WORK EXPERIENCE

Supply Chain Digitalization Specialist, Mondelez International | Contractor **Apr 2026 - Oct 2026**

- Led digital transformation initiatives across supply chain operations by leveraging Excel, VBA, Power Query, Power Automate, and Power BI. Automated recurring reporting and operational workflows, reducing manual effort and improving data visibility for stakeholders.
- Designed and implemented automated solutions integrating Power Automate, VBA, Microsoft Office applications, and SAP data. Streamlined key Order-to-Cash processes - including debt clearing through SAP T-codes, net-off management, and order creation - helping teams minimize manual processing and access real-time information for faster decision-making.
- Developed interactive Power BI dashboards to monitor critical supply chain and logistics KPIs, including Days Sales Outstanding (DSO), overdue payments, next-day order fulfillment, transport track-and-trace status, and warehouse capacity utilization. Enabled management and operational teams to identify bottlenecks earlier and make more data-driven decisions.
- Partnered with technical support teams and cross-functional stakeholders to analyze operational issues, standardize workflows, and improve process efficiency across departments. Contributed to stronger collaboration between Supply Chain, Finance, Sales, and IT functions.
- Supported the enhancement of logistics capabilities through the TMS project by contributing to real-time GPS tracking, geo-fencing logic, and API integration with sales platforms for distributor mobile applications. Improved shipment visibility and provided a foundation for more proactive transport monitoring and exception management.

Process Optimization Engineer, Nam Thuan Apparel Manufacturing **Apr 2025 - Apr 2026**

Worked in a team responsible for analyzing and redesigning internal operations across production, warehouse, and procurement to support the development of an internal ERP system. Also contributed to operational efficiency initiatives and customer feedback analysis to support data-driven decision-making.

- **Project 1: Order Management System**
  - **Issue**: Order statuses were tracked inconsistently across teams, causing miscommunication and delays throughout the fulfillment process.
  - **Action**: Mapped the end-to-end order workflow using BPMN, standardized status definitions, and developed UAT checklists, training materials, and handover documents. Coordinated testing, issue resolution, and go-live activities.
  - **Result**: Delivered a stable system launch with 100% user adoption and reduced order cycle time by 10%.
- **Project 2: Transfer Batch Management (Raw Material Movement Tracking)**
  - **Issue**: Raw material batches were transferred between departments without a unified tracking system, resulting in frequent reconciliation errors and limited visibility into batch status.
  - **Action**: Designed a transfer batch workflow with clear status milestones, standardized batch codes, and formal handoff rules between the PPC and Warehouse departments using Excel. Built a Power BI dashboard to monitor batch status and flag pending actions in real time.
  - **Result**: Achieved 100% end-to-end traceability of raw material movements and reduced manual reconciliation time by 40%.
- **Project 3**: **Warehouse & Raw Material Inventory Management** (GitHub)
  - **Issue**: Inventory data was scattered across manually updated files, making it difficult to obtain an accurate view of stock locations, inventory levels, movements, and overstock or stockout risks.
  - **Action**: Designed standardized records for all inventory transactions, including inbound, QC, stock, issue, and transfer activities. Automated data refreshes and aging alerts using Power Query and Office Scripts, and centralized all records under version control.
  - **Result**: Improved inventory data accuracy to 98% and saved more than 20 man-hours per month.
- **Project 4**: **Workforce Planning by Skill Matrix** (GitHub)
  - **Issue**: Weekly staffing decisions were based largely on intuition, with no formal record of worker capabilities, leading to bottlenecks and untracked skill gaps across production lines.
  - **Action**: Built a worker-by-operation-by-capability-level skill matrix in Excel and developed an optimization model using a MILP algorithm in Python. Generated planning scenarios to identify bottlenecks and training gaps.
  - **Result**: Improved line efficiency by 12% and reduced weekly staffing planning time from 4 hours to 15 minutes.

Manufacturing Technology Engineer Intern, SHOWA Gloves Viet Nam **June 2024 - Oct 2024**

- Supported the modification of mold material structures to eliminate defects in finished products.
- Collaborated with production teams to test new products on the line, from standardizing raw materials to adjusting equipment conditions.
- Conducted studies on sublimation printing conditions, including temperature and material factors, for new product development.
- Compiled process data from production equipment into internal documentation to standardize parameters and prevent large-scale defects. **Project**: Led a corrective action project by repositioning the heating panel from horizontal to vertical, **reducing the finished product defect rate from 30% to 7%** and lowering rework costs.

EDUCATION

Ho Chi Minh University of Technology **2020 - 2024**

Bachelor of Chemical Engineering

- Major in Process and Equipment.
- GPA: 7.81

SKILLS AND LANGUAGES

- Languages: Vietnamese (native), English (intermediate - TOEIC 780).
- Supply Chain Analytics: Certified by the Supply Chain Analyst Program, VILAS.
- Data Analytics: Certified by the Data Analyst Certification Program, DataCamp.
- Data Processing and Automation: Excel (Power Query/Pivot/VBA/Office Scripts), Python (pandas, NumPy).
- Optimization: Excel Solver, Python (Gurobi).
- Data Visualization: Power BI, Python (seaborn, matplotlib).
- Process Modeling: BPMN 2.0 (business process diagrams), UML Class Diagrams, Workflow design (Miro).
